

**IN THE SPECIFICATION**

Please replace the paragraph on page 14, line 16 to page 15, line 2, of the specification, as previously amended, with the following marked-up replacement paragraph:

--As a consequence of the angulation of its handle, the utility knife is especially convenient for use in window glazing applications, since the hand is not located in-line with the blade. The angulation may be in the range of about 100 degrees to about 170 degrees and more preferably between about 135 to about 150 degrees. The knife no longer needs to be angled in making cuts in tight corners and cuts, which is essentially perpendicular to the surface can be easily made since the size of the hand is accommodated by the angulation of the handle. The utility knife can be used in right angle applications such as scoring of linoleum or sheet rock in tight places, such as corners and the like. Previous utility knives have been stubby and straight. These prior art configurations prevented facile operation of the knife, owing, in part, to interference from the operator's hands. --
